Nvidia Sales Dashboard

Analysis and Outcomes from a Power BI Dashboard

Performance. Progress. Process.

1. Introduction

This report presents the results of a data visualization project built on an Nvidia sales dataset using Microsoft Power BI. The aim of the project was to turn raw sales data into a clear, interactive dashboard that helps in understanding sales performance across products, regions, years and payment terms.

The report first describes the dashboard as a whole, then explains what each screenshot shows, and finally summarises the outcomes (what we learned) from the analysis.

1.1 Objectives

- Track key sales measures such as gross profit, gross revenue, net revenue and units sold.
- Understand which payment terms, countries and product categories perform best.
- Study how units sold change from year to year so that upcoming demand can be predicted.
- Present the findings in a simple, professional and easy-to-read dashboard.

1.2 Tool and Dataset

The dashboard was built in Microsoft Power BI using the Nvidia sales dataset (last updated on Oct 15, 2026). It includes filters for Payment Term, Month, Year, Region and Product Category, so users can explore the data from different angles. The design follows a dark theme with Nvidia's signature green colour.

2. Dashboard Overview

Screenshot 1: Main Nvidia Sales Dashboard

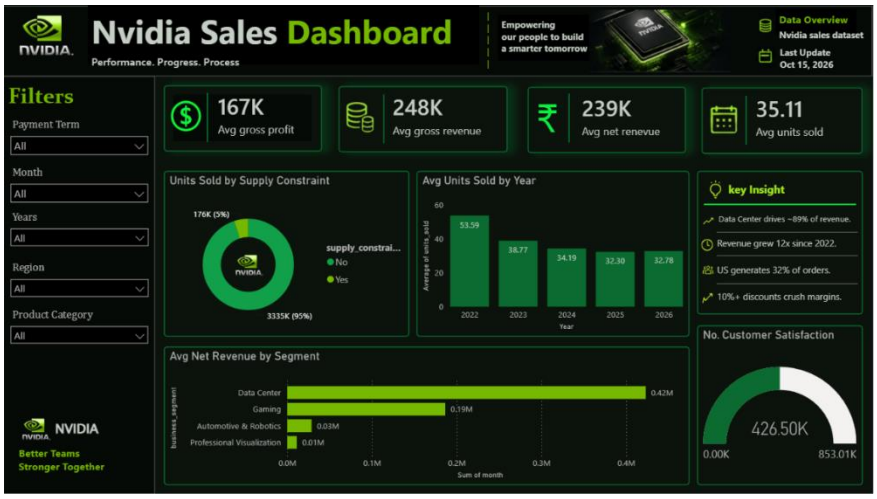

Figure 1: Nvidia Sales Dashboard (main page)

What this screenshot shows

This is the main page of the dashboard. It brings the most important numbers and charts together in one place. Its parts are:

- **KPI cards:** Average gross profit (167K), average gross revenue (248K), average net revenue (239K) and average units sold (35.11).
- **Units Sold by Supply Constraint:** A donut chart showing that 95% of units (3,335K) were sold with no supply constraint, while 5% (176K) were affected by one.
- **Avg Units Sold by Year:** A column chart showing the average units sold falling from 53.59 in 2022 to 38.77 in 2023, 34.19 in 2024, 32.30 in 2025 and 32.78 in 2026.
- **Avg Net Revenue by Segment:** A bar chart in which Data Center is far ahead (0.42M), followed by Gaming (0.19M), Automotive & Robotics (0.03M) and Professional Visualization (0.01M).
- **Key Insight panel:** A short summary of the main findings (see Section 4).
- **Filters:** Slicers on the left for Payment Term, Month, Years, Region and Product Category.

Outcome

The main page gives a quick, one-glance view of business performance. Data Center is clearly the biggest revenue segment, almost all units are sold without supply problems, and the average units sold per year have settled at around 32-33 after a high in 2022.

3. Detailed Analysis of Screenshots

3.1 Payment Term by Units Sold

Screenshot 2: Payment term by unit sold

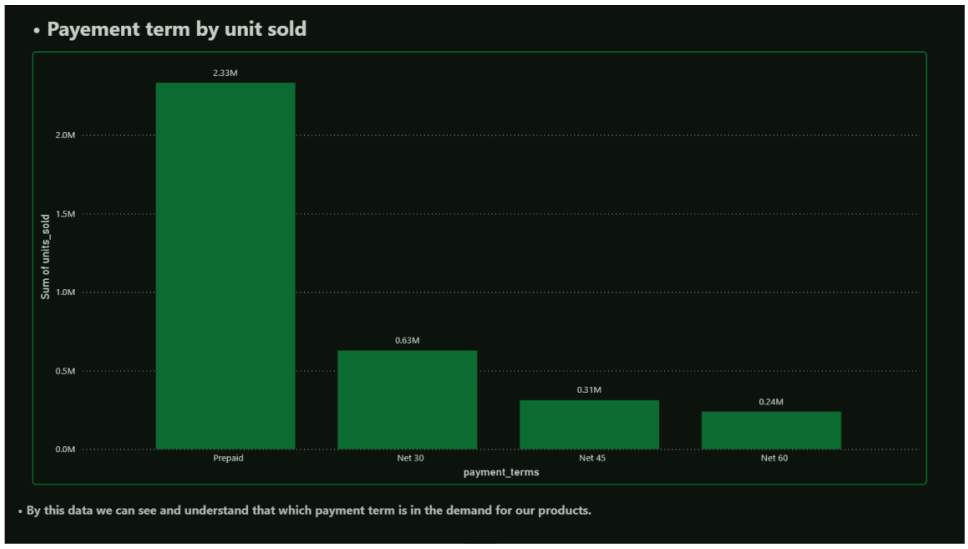

Figure 2: Units sold by payment term

What this screenshot shows

This column chart compares the total units sold under each payment term: Prepaid, Net 30, Net 45 and Net 60. It tells us which payment term is in demand for the products.

Payment Term	Units Sold	Approx. Share
Prepaid	2.33M	66%
Net 30	0.63M	18%
Net 45	0.31M	9%
Net 60	0.24M	7%

Outcome

- Prepaid is by far the most popular payment term, with about two-thirds of all units sold.
- Demand falls as the credit period gets longer: Net 30 is the most used credit term, and Net 60 the least.
- Customers clearly prefer to pay upfront, which is good for cash flow and lowers payment risk.

3.2 Maximum Net Revenue by Country

Screenshot 3: Max net revenue generated by each country

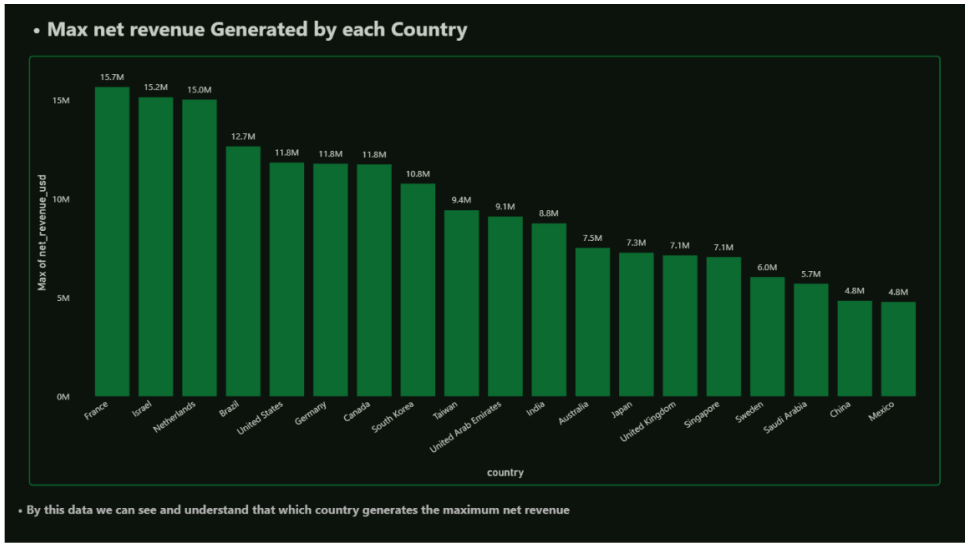

Figure 3: Maximum net revenue (USD) by country

What this screenshot shows

This column chart ranks 19 countries by their maximum net revenue (in USD). It shows which country generates the most net revenue and which generate the least.

Group	Countries	Max Net Revenue
Top 3	France, Israel, Netherlands	15.7M, 15.2M, 15.0M
Middle	Brazil, US, Germany, Canada, South Korea	12.7M to 10.8M
Lowest	Saudi Arabia, China, Mexico	5.7M, 4.8M, 4.8M

Outcome

- France generates the highest net revenue (15.7M), closely followed by Israel (15.2M) and the Netherlands (15.0M).
- The United States, Germany and Canada are level at 11.8M each.
- China and Mexico are at the bottom with 4.8M each, so they have the most room to grow.

3.3 Average Units Sold by Year in Each Category

Screenshot 4: Avg units sold by years in each category

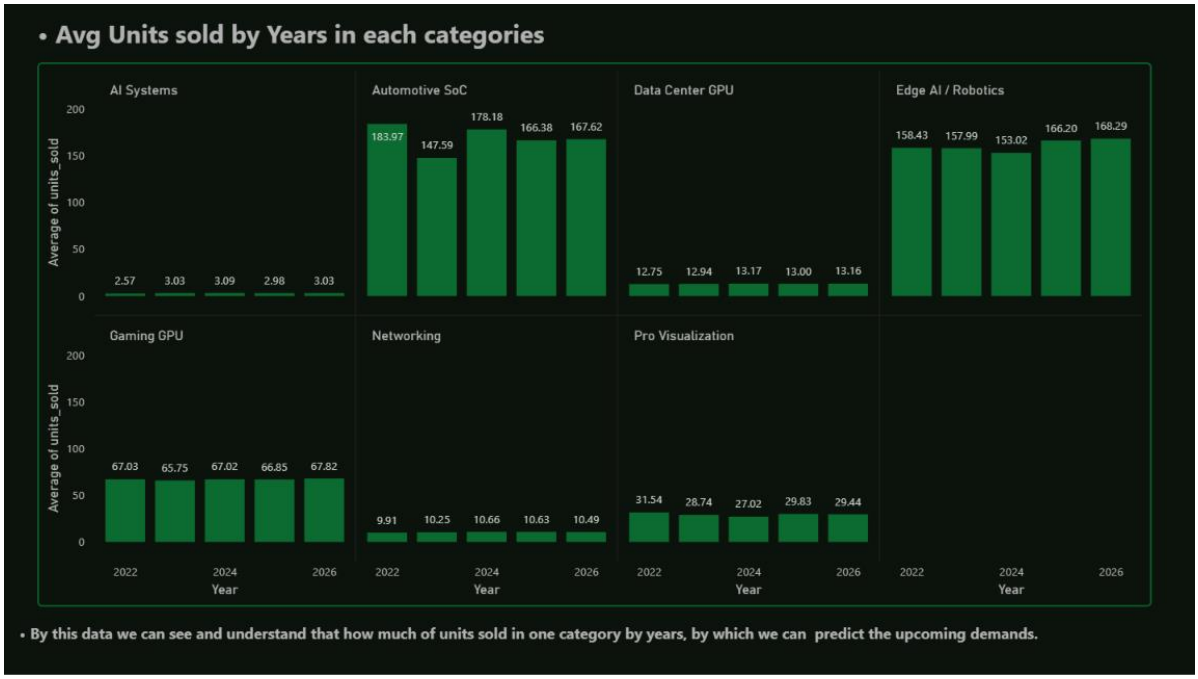

Figure 4: Average units sold by year, for each product category (2022 to 2026)

What this screenshot shows

This chart has a small panel for each product category and shows its average units sold in every year from 2022 to 2026. It helps us see how demand for each category changes over time, and so predict upcoming demand.

Category	2022	2026	Trend
Automotive SoC	183.97	167.62	Down, but still high
Edge AI / Robotics	158.43	168.29	Growing
Gaming GPU	67.03	67.82	Stable
Pro Visualization	31.54	29.44	Slight decline
Data Center GPU	12.75	13.16	Stable, low volume
Networking	9.91	10.49	Stable, low volume
AI Systems	2.57	3.03	Stable, very low volume

Outcome

- Automotive SoC and Edge AI / Robotics are the highest-volume categories, at around 150 to 185 average units. Edge AI / Robotics reached 168.29 in 2026 and moved slightly ahead of Automotive SoC (167.62).
- Gaming GPU is very steady at about 67 units every year.

- Data Center GPU has a low average unit count, yet the dashboard shows Data Center drives most of the revenue. This suggests each Data Center unit carries a much higher value.
- Since most categories follow a stable yearly pattern, the data can be used to forecast future demand.

4. Key Outcomes

The Key Insight panel of the dashboard and the detailed charts together lead to the following main outcomes:

Area	What we found
Revenue source	Data Center drives about 89% of revenue.
Growth	Revenue has grown about 12x since 2022.
Market	The US generates 32% of orders; France, Israel and the Netherlands lead on maximum net revenue.
Pricing	Discounts of 10% or more reduce margins sharply.
Payment terms	Prepaid is the preferred payment term (about 66% of units).
Supply	95% of units were sold with no supply constraint.
Demand pattern	Average units sold per record fell from 53.59 (2022) to about 32-33 (2025-2026) and have now levelled off.

4.1 Suggestions

- Keep Data Center as the main focus, since it brings in most of the revenue.
- Control discounts, and avoid giving more than 10% unless it is really needed, to protect margins.
- Promote prepaid deals and keep credit terms limited to trusted customers.
- Look for growth in lower-revenue countries such as China and Mexico.
- Use the yearly category trends to plan stock and production for the coming year.

5. Conclusion

The Nvidia Sales Dashboard turns a large sales dataset into clear and useful insights. Through simple KPI cards, filters and charts, it shows which payment terms, countries and product categories matter most. The main takeaways are that Data Center is the strongest revenue driver, prepaid is the most preferred payment term, France, Israel and the Netherlands are the top countries by net revenue, and discounts above 10% hurt margins.

Overall, the project shows how Power BI can be used to support better business decisions by presenting data in a way that is easy to understand.
